

METHOD AND APPARATUS FOR HIERARCHICAL SELECTIVE PERSONALIZATION

Abstract of the Disclosure

Techniques are provided for improved serving of content in a distributed data
5 network. In one aspect of the invention, a technique for delivering content in a
client-server system based on a request from a client comprises the following
steps/operations. The request is obtained. A performance characteristic of at least one
server or at least one cache of the client-server system is determined. Then, a level of
data accuracy to be delivered to the client in response to the request is determined. The
10 data accuracy determination is based on: (i) the determined performance characteristic of
the at least one server or the at least one cache; and (ii) at least one preference associated
with the client. The performance characteristic may comprise a load of the at least one
server or the at least one cache. The level of data accuracy may comprise a level of
personalization to be delivered to the client in response to the request. The at least one
15 preference associated with the client may comprise at least one personalization
preference.
